

Firmware Update Service for HPE ConvergedSystem 300 for Microsoft Analytics Platform

Increase IT reliability and stability

Turn to HPE experts for firmware updates when technical assistance is needed to:

- Implement firmware updates quickly and efficiently
- Reduce disruption to your IT environment

Hewlett Packard Enterprise is your (trusted) partner

- You get service delivered by HPE technical experts.
- You get access to deep network of HPE support and R&D teams who can assist on unforeseen issues.
- You can focus on core business issues rather than firmware updates.

Minimize disruption

- Simplified firmware update management
- Lower risk and complexity
- Improved system performance and reduced downtime

Achieve time savings with superior support

- Implement firmware updates in a timely fashion
- Reduce your time investment

Rely on expert firmware updates

Ensuring that your HPE ConvergedSystem 300 for Microsoft® Analytics Platform appliance is in compliance with the latest firmware versioning is critical to keep your system running at peak performance. Protect your system from unexpected hardware downtime with Firmware Update Service for HPE ConvergedSystem 300 for Microsoft Analytics Platform.

Giving you what you need, when you need it

HPE ConvergedSystem 300 (CS300) for Microsoft Analytics Platform (APS) is purpose-built with HPE ProLiant servers, factory-integrated, and tuned to meet your data-intensive Big Data, business intelligence (BI), and analytics workloads. Built on Microsoft technologies, this turnkey data warehouse appliance offers the power of massively parallel processing (MPP) architecture and In-Memory Columnstore for dramatically faster query execution performance, giving you faster time to insight.

System outage can be unforgiving

An outage could put you at the center of chaos with a business imperative to recover and restore your services as soon as possible. The business impacts of a failure can make or break you in an unforgiving, competitive market: lost revenue, lost customers, poor productivity, litigation or panelist, damage

to your brand, reputation, and stock price. It is nearly impossible to meet the business needs within hours, even minutes, of downtime. What's worse is that every business opportunity lost most likely means an opportunity gained for your competitors.

Updating firmware is critical, but can be complex and time consuming

Keeping your CS300 for Microsoft Analytics Platform appliance running at peak performance is critical. Each appliance is validated and tested to run a specific combination of software, firmware, and drivers. The Master Reference Architecture (MRA) lists the tested firmware and driver "recipe" supported for a particular version of the SQL Server platform augmented with the MPP engine.

Updates to ConvergedSystem appliances are necessary to keep your system up to date, and are intended to help prevent issues caused by known problems and enable you to obtain product enhancements, as they are made available. Firmware updates are typically required after a Microsoft Appliance Update (AU) and are crucial for maintaining the overall health of the components included in the hardware stack.

Managing the process of keeping the system in compliance with the latest firmware versions may require you to invest a significant time. Furthermore, implementing firmware updates on all the components of the appliance—servers, storage, and networking—can be complex and time consuming.
