## Remote Lab Testing Directions Guru

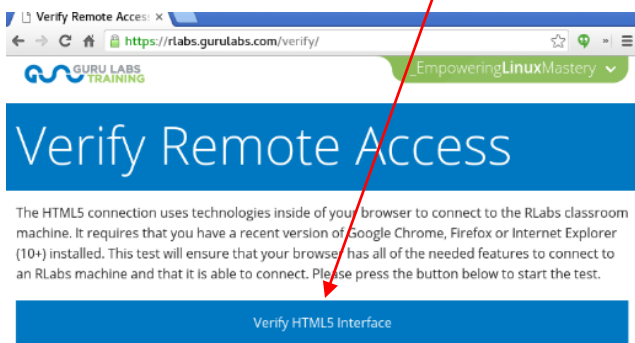

---

### Test your HPE Virtual lab access

Using the computer, user account, network settings, firewall settings, and web browser that you will be using to attend class, go to the following URL:

<https://rlabs.gurulabs.com/verify>

When you see this screen, click on Verify HTML5 Interface.

The system will perform a brief sequence of tests. If the page reports "It Worked!" then no further actions are required and your system has been verified to work with the lab system. Please note that your instructor will assign specific credentials for accessing your lab systems on the first day of class.

### RLabs Feature Verification Test

Browser supports websockets	Success
Retrieve access credentials from RLabs	Success
Message server connection initialized successfully	Success
Connected to websocket message server	Success
Send client message to the websocket server	Success
Message 1 received from the websocket server	Success
Message 2 received from the websocket server	Success
Websocket connection closed	Success

It worked!

You're all set and ready to go

On your first day of class, your instructor will give you a code which can be used to access your machine.

If the page reports a failure of one or more components, then it will suggest actions you can try to resolve the issue. It will then automatically direct you to a form to file a request for further assistance.
